

Github Link: <https://github.com/Carolyn1128/PetKeeper>

- So far for the home page, I had a bottom at top right which allow people to upload an image of their pet.
- User can click on the calendar icon to check all appointments
- The medicine icon to check what medicine their pet is using and the dog icon to edit the information of the pet.
- The food and water button can start a timer link to the progress view so user can know do they need to add more food or water or not. (For testing, I made the timer to go to 0 really fast).
- The Pet-walker icon is another timer which will reset after pressed, it is to show the user how long they did not bring their pet to outside.

For the Appointment page, user can see all appointment. Click on the + button to add a new appointment and slide the left to delete the Appointment. Used CoreData for both appointment and medicine page so all information will be saved to phone.

The Medicine page is basically the same thing as the Appointment page but with different information.

The information Page allow user to input information of their pet. User can click on the text to edit.
